You just need to know a few smart tricks:

These **5** CSS Techniques can take your design from **Basic** to Polished

01. **Use a Reset or Normalize CSS**

Sometimes your design looks weird, even though your code is fine. Why? Because browsers apply their own default styles. To fix this, always add this at the top of your CSS:

```
* {
    margin: 0;
    padding: 0;
    box-sizing: border-box;
}
```

02. Use Variables for Colors and Fonts

Want to keep your colors and font sizes consistent?
Use CSS variables.

```css
:root {
  --main-color: #007bff;
  --font-size: 16px;
}

body {
  color: var(--main-color);
  font-size: var(--font-size);
}
```

03

03. Responsive Font Size with clamp()

Instead of writing media queries for every screen size, try this:

font-size: clamp(1rem, 2.5vw, 2rem);

It means:
- Minimum font size = 1rem
- Ideal font size = 2.5% of screen width
- Max font size = 2rem

So your text resizes nicely on mobile, tablet, and desktop without extra code.

04. **Smooth Scrolling**

If you're using anchor links like #about, make the scroll behavior smooth:

```css
html {
  scroll-behavior: smooth;
}
```

Now when someone clicks a link, the page will scroll down smoothly.
Looks way better than jumping directly.

05. Aspect Ratio for Clean Layouts

Want a video or image box that always stays in shape?

```
.card {
  aspect-ratio: 16 / 9;
}
```

This keeps the element's width and height in a fixed ratio.
Great for responsive videos, cards, or image galleries.
